

1. Cloud deployment link: <https://ruby-portofolio.onrender.com/>

2. The name of the deployed platform: Render

3. How many APIs have you connected in series and which APIs you use:

I have connected three APIs. The weather forecast feature uses a series of two APIs from OpenWeather.

Gemini API: Used for the AI Assistant chatbot feature.

OpenWeather API: Used for the weather forecast. This involves two API calls in series: first, the Geocoding API to get the latitude and longitude of a city, and second, the Current Weather Data API to retrieve the weather information for those coordinates.

Google Maps API:\*\* Used to embed an interactive map on the contact page.

4. Brief description of the deployment method:

The website is deployed to Render and linked to a GitHub repository. Continuous deployment is set up, which means that Render automatically detects changes pushed to the GitHub repository, and then builds and deploys the updated version of the site.
